

# Trending Issues of Radiation Protection for External Beam Radiation Oncology

Thomas Rockwell Mackie

Morgridge Institute of Research  
Emeritus Investigator

University of Wisconsin  
Emeritus Professor

# Disclosure and Potential Conflicts of Interest Statement

- I am a advisor to Provision CARES, a company building and operating proton cancer centers.

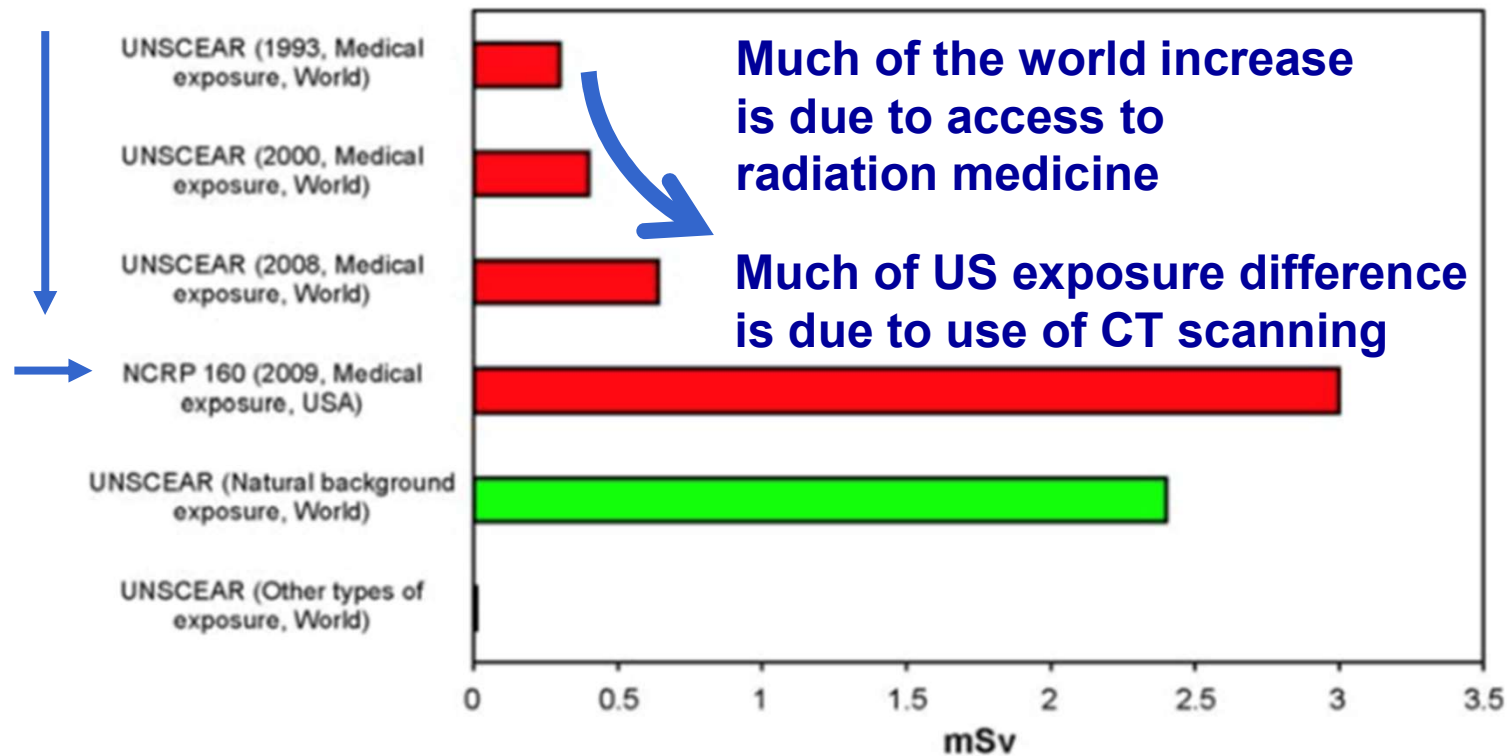

- I am a co-founder and board member of Leo Cancer Care™, a company developing an upright radiotherapy system.

# Outline

- **Medical radiation exposure is increasing.**
- **Modern radiation therapy is devoted to decreasing acute exposure to sensitive tissues using 3D conformal radiation therapy and intensity modulated radiotherapy (IMRT).**
- **Proton beams vs. x-ray beams.**
- **Image-guidance in radiotherapy.**
- **Integral dose – a simple measure of patient harm.**
- **Types of photon beam radiotherapy.**
- **Emergence of MRI-guided radiotherapy.**
- **Reduction in radiation bunker (vault) sizes.**

# Medical Radiation Exposure

**Fig. 1.** Increasing annual per caput effective dose to the worlds population from medical exposure, compared with natural background and other exposure [1,2], and the annual per caput effective dose from medical exposure to the U.S. population [3].

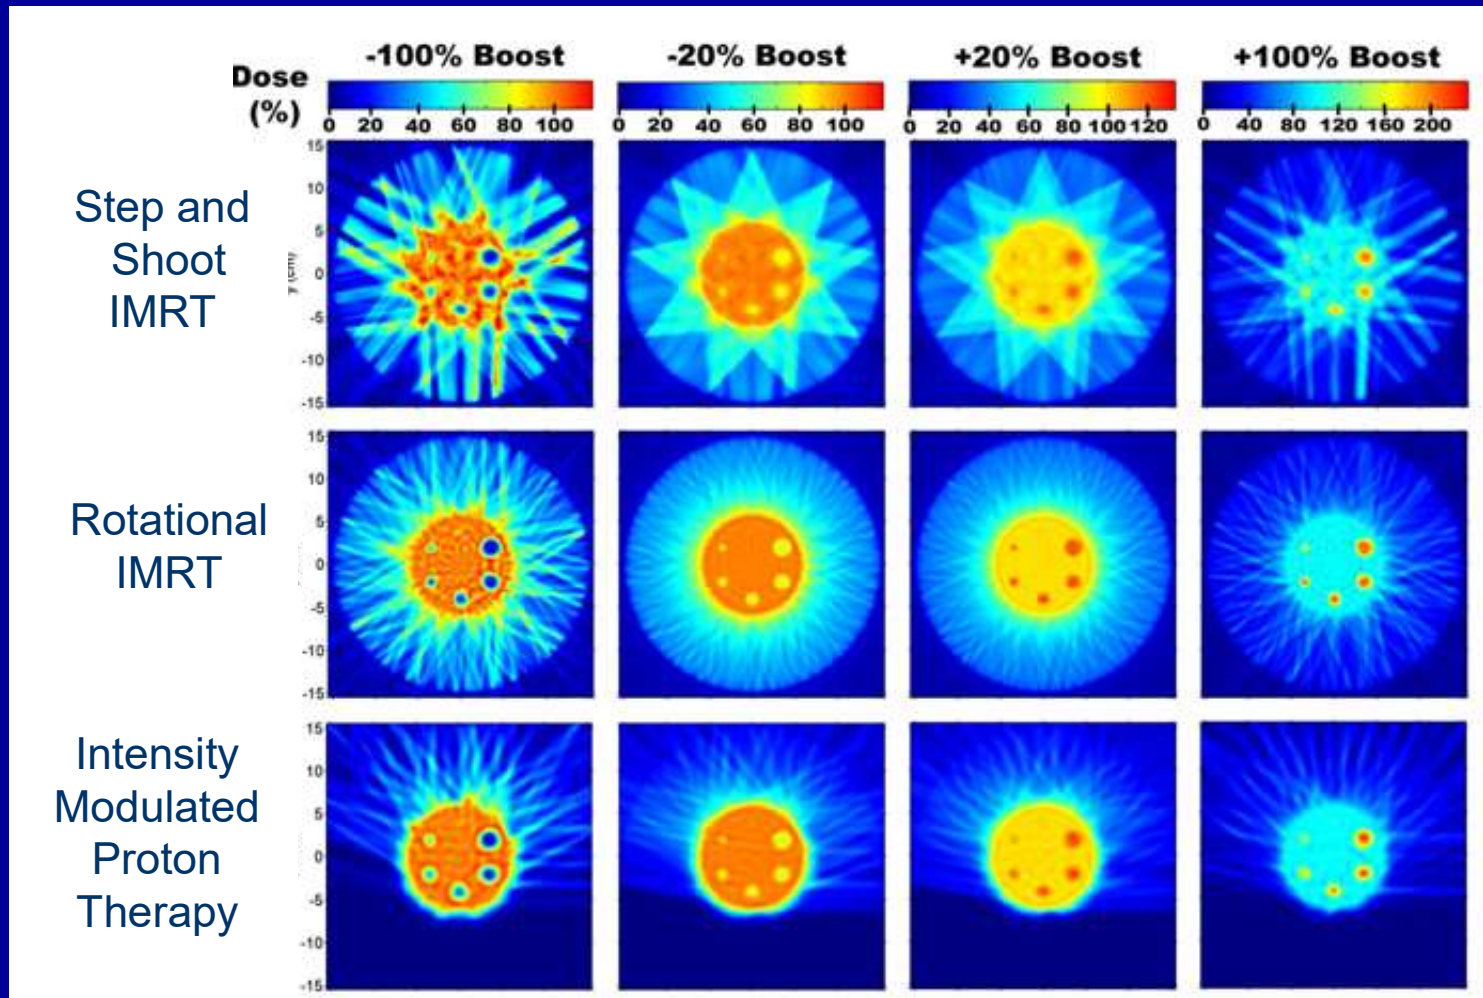

# Dose Contrast Resolution

Apply Boost or Avoidance (Negative Boost) Dose to Regions of Varying Size

Flynn et al., Comparison of intensity modulated x-ray therapy and intensity modulated proton therapy for selective subvolume boosting: A phantom study. Phys. Med. Biol. 52, 6073-6091 (2007).

# Dose Contrast Resolution

# US Proton Centers

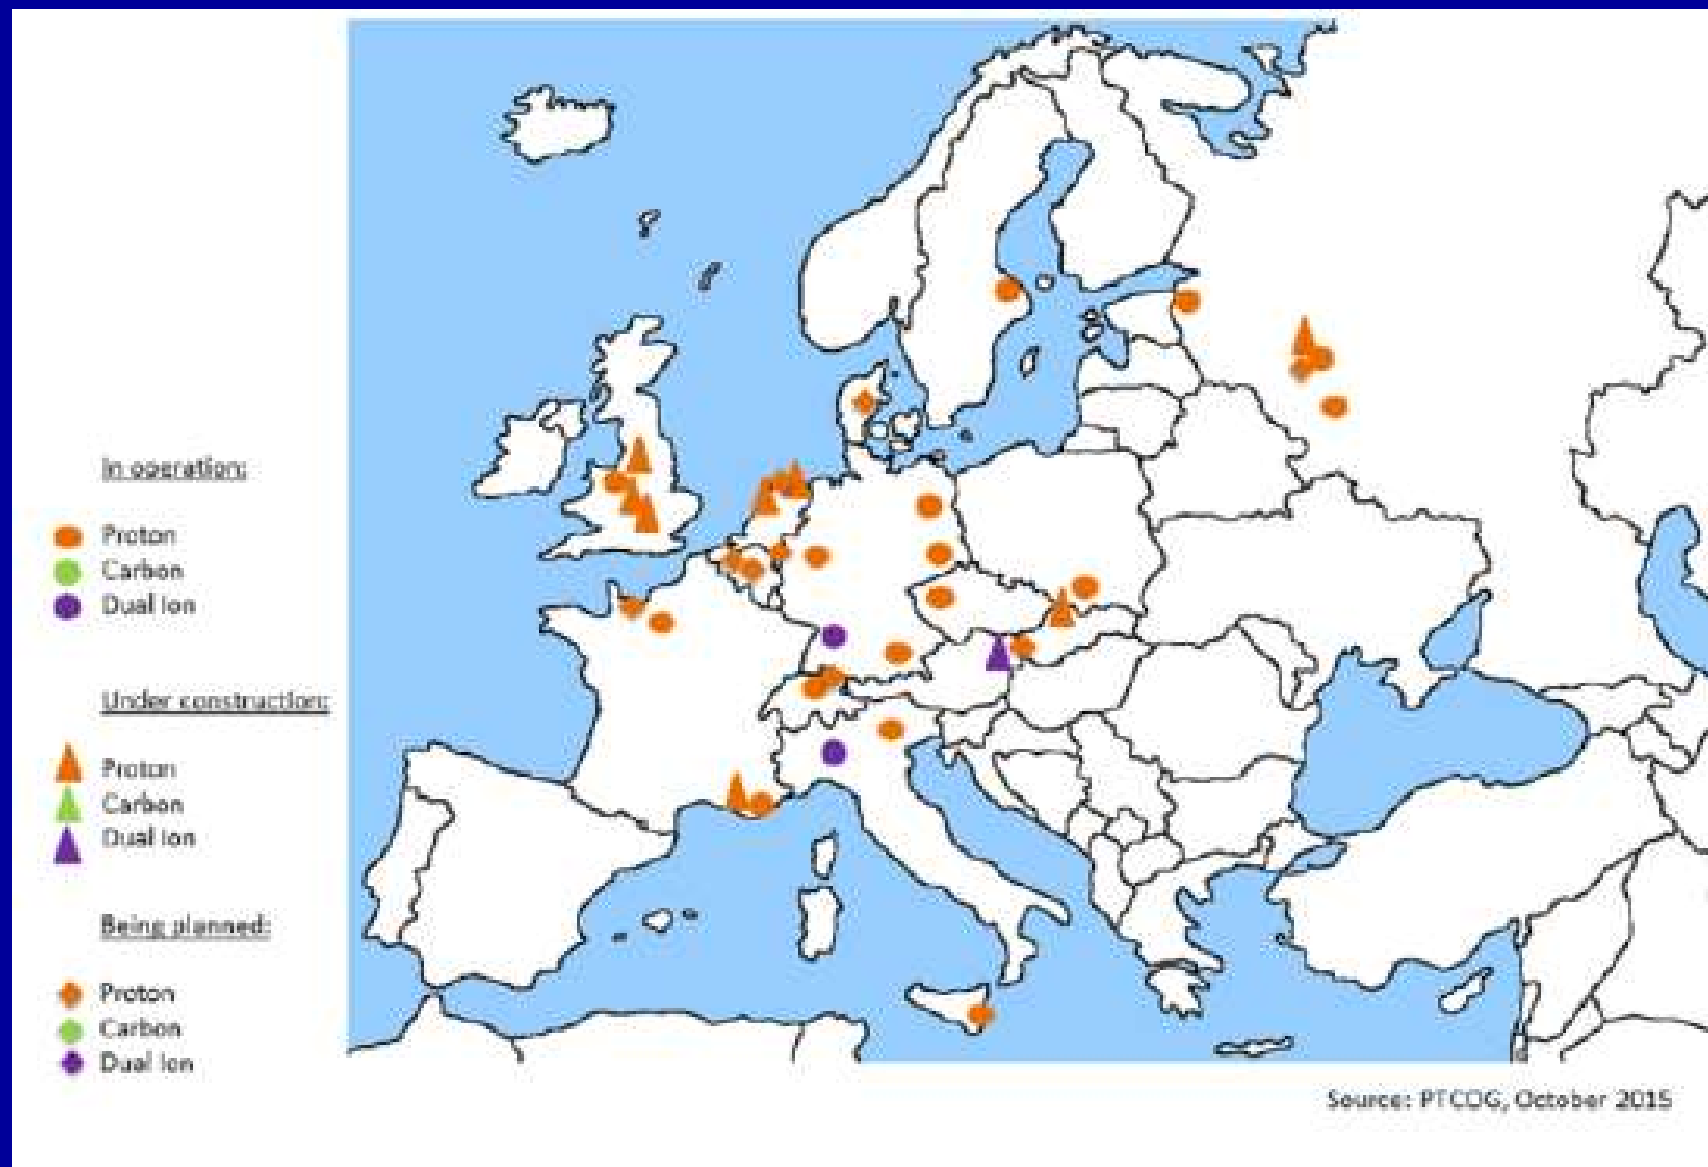

September 2017

## PROTON THERAPY CENTERS

USA	Centers	Rooms
In Operation	26	79
Under Construction	10	32
In Development	<u>22</u>	<u>36</u>
TOTAL	58	147

Number of proton centers is accelerating in the US.

# Dose Distribution for IMRT

# Cumulative Dose-Volume Histogram

Area Under the Curve is the Integral Dose to the Structure

# Integral Dose

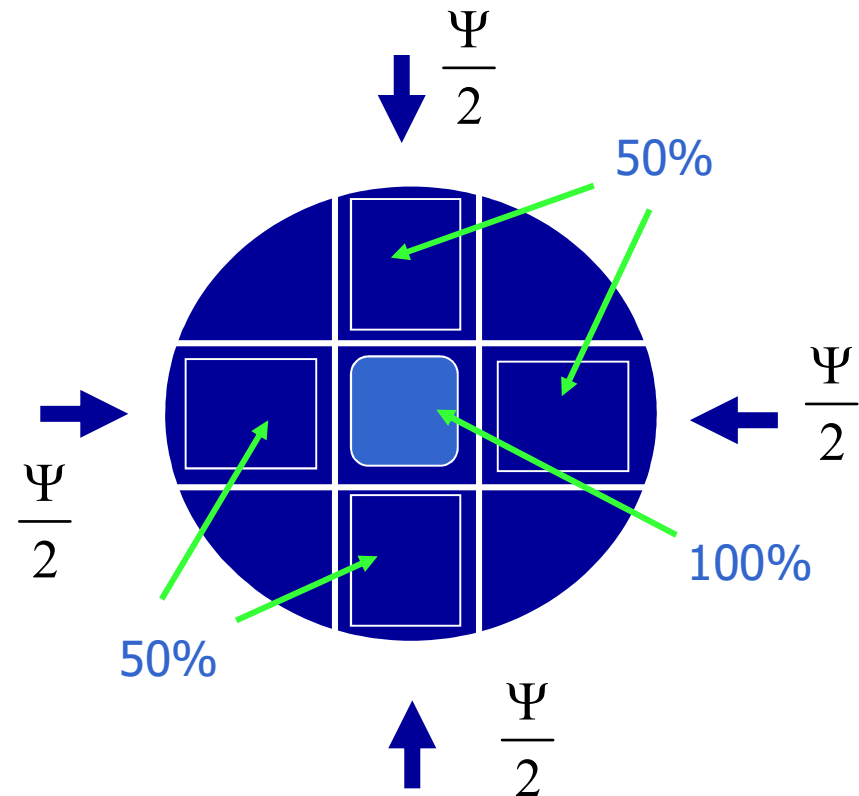

- For megavoltage photon beams the integral dose to patients is nearly invariant with technique of delivery.
- Integral dose in units of Gy-liter for a structure is equal to the product of mean dose and volume of the structure.
- Note that using a definition of integral dose as energy in J instead of Gy-liter reduces the impact of low density tissues like lung and raises the impact of high density tissues like bone.
- The components of integral dose are:
  - In-field dose including electron contamination
  - Outside-field leakage dose
  - Neutron contamination

# Integral Dose is Independent of the Number of Fields

## Parallel Opposed

## Four-Field Box

**A four-field box has half the energy fluence from each of the beams and results in double the volume of normal tissue irradiated to half the dose.**

# Intensity Modulated Radiation Therapy (IMRT)

A wedge is a primitive form of IMRT delivery.

The energy fluence values are non-uniform and dose values now refer to volume averages.

With leakage neglected, the integral dose is invariant with technique for both uniform and non-uniform delivery.

## **Radiobiology of Integral Dose**

- **Intensity Modulated Radiation Therapy (IMRT) tends to deliver less dose to a larger volume.**
- **However with IMRT it is possible to avoid high doses to those structures, such as the thyroid and breast, that have the highest probability of a radiation-induced malignancy.**
- **A low dose bath is produced well away from the tumor volume due to beam entrance and exit (for photons only), leakage from the collimation system, and neutron production.**

# Multileaf Collimators

## Conventional

## Binary

- Conventional MLC's were designed for field shaping and have limitations when used for IMRT.
- Binary (off-on) MLC's are designed for IMRT and are the easiest to model and verify.

# Cone Beam CT

- David Jaffray pioneered cone beam CT at Beaumont Hospital Hospital in Michigan.
- kV CT scanning with some speed limitations due to detector response

David Jaffray

Elekta Synergy

# Accuray TomoTherapy

- TomoTherapy pioneered:
  - Daily CT guided radiotherapy.
  - Rotational Intensity Modulated Radiation Therapy (IMRT) using helical tomotherapy.
  - Helical delivery (to obtain long treatment fields).
  - Thicker primary collimation and multileaf collimator.

# Varian Halcyon

- The Halcyon is designed to do rotational IMRT (Rapid Arc).
- KV cone-beam.
- Halcyon has a slower gantry than Tomo.
- Halcyon does not have a slip ring so it cannot do extended field lengths.
- Fastest selling Varian linac.

# Accuray CyberKnife

- Multi-axis robot attached linac and collimation system
- Designed for stereotact radiosurgery (SRS) but also used for prostate, lung, and other body radiotherapy sites
- Dual real-time fluoroscopy

# Comparison of External Beam Techniques

Fig. 1. Shape and relative position of volumes of interest (target and OARs) for three cases included in the study. Data are shown on a CT slice corresponding to roughly the centre of the target.

Comparison between:  
Protons, Stereotactic Radiosurgery, 3D Conformal,  
Conventional IMRT, Helical Tomotherapy

Yartsev et al, Radiotherapy and Oncology 74 (2005) 49-52

# Comparison of External Beam Techniques

Table 1  
Results of dose distribution for the target and OARs

Optic nerve omolateral	Mean	20.7 ± 16.0	8.2 ± 11.3	16.2 ± 17.5	18.6 ± 18.3	4.7 ± 9.9	6.6 ± 11.1
	Max pt	34.6 ± 30.6	22.7 ± 30.7	32.4 ± 29.5	36.5 ± 33.8	21.6 ± 33.3	24.7 ± 33.3
Optic nerve controlateral	Mean	14.0 ± 8.7	5.3 ± 6.3	10.4 ± 8.8	14.2 ± 13.4	0.4 ± 0.7	0.7 ± 1.3
	Max pt	19.3 ± 12.0	8.1 ± 12.1	18.4 ± 13.6	24.3 ± 18.4	4.8 ± 11.1	5.6 ± 10.8
Eyes	Mean	9.6 ± 4.5	2.9 ± 1.4	6.7 ± 5.5	8.4 ± 5.8	0.0 ± 0.1	0.1 ± 0.1
	Max pt	16.8 ± 7.7	4.9 ± 3.3	14.5 ± 6.4	18.7 ± 8.3	0.8 ± 2.0	1.0 ± 1.9
Brain—(brain stem + target)	Mean	6.7 ± 3.4	7.3 ± 2.8	6.7 ± 2.7	8.0 ± 2.8	2.2 ± 1.3	1.8 ± 0.9
	V <sub>20</sub>	3.7 ± 3.3	7.8 ± 5.9	9.8 ± 6.0	11.2 ± 5.9	3.6 ± 2.3	3.2 ± 1.5

## Mean Brain Dose:

Photons

Rotation IMRT	6.7%
SRS	7.3%
3DCRT	6.7%
IMRT	8.0%

Protons

PSP	2.2%
SSP	1.8%

- Mean dose (mean dose is proportional to integral dose) is similar to or less than other photon techniques
- Proton radiotherapy has much smaller mean dose.

# **A Study On Integral Dose for Prostate Radiotherapy**

**5 consecutive prostate patients were planned.**

# Why In-Field Integral Dose Is Nearly Beam Quality Independent

High energy has both longer longitudinal and lateral electron transport

High energy does have deeper buildup which reduces integral dose.

High energy needs wider field boundary which increases integral dose.

High energy has higher exit dose which increases integral dose.

**Neutron Dose**

**High Energy**

**Low Energy**

Low energy has both shorter longitudinal and lateral electron transport

Low energy has smaller buildup

Low energy needs narrower field boundary

Low energy has smaller exit dose

**No Neutron Dose**

# Medical Physics

The International Journal of Medical Physics Research and Practice

Higher energy: Is it necessary, is it worth the cost for radiation oncology?

# ViewRay MRIdian

- ViewRay MRIdian uses a 0.35 T split magnet system.
- A beam goes between the magnets.
- Real-time imaging.
- Built-in gating to manage motion.
- Delivers 3D conformal and IMRT.

# Elekta Unity

- The Elekta Unity is similar to the ViewRay except:
- Uses 1.5 T magnetic field so better images.
- Does not yet facilitate gating.
- More expensive.
- Beam goes through magnet system.

# Elekta Unity

# Minimum Conventional Bunker for a C-Arm Gantry

Varian Trilogy

Using non-coplanar fields makes classical bunkers large as the couch has to rotate.

# Examples of Ring Gantries

**TomoTherapy**

**Elekta Unity**

**View Ray**

**Edmonton Linac-MRI**

**Varian**

**Reflexion Medical**

# Shielding Issues with Ring Gantries

- **Cannot deliver non-coplanar fields but modern radiotherapy rarely uses non-coplanar fields.**
- **Easy to put a beam stop built into the machine.**
- **Patient scatter becomes the dominant contribution for unwanted radiation.**
- **Can also put extra shielding into the machine covers.**
- **Rooms can be smaller so less total shielding required.**

# Decreasing Unwanted Integral Dose

Up to 23 cm of Tungsten  
In the Primary Collimator.  
< 0.01% Leakage

Leaves are 10 cm of Tungsten.  
< 0.3% Intraleaf Transmission  
< 0.5% Interleaf Transmission

No Field Flattening Filter to  
Cause Scatter Outside the Field.

Less Head Scatter from  
Narrow Fields.

10 cm Thick Lead Beam Stop  
Behind the Radiation Detector.

Courtesy TomoTherapy

# Varian Halcyon ... 2017

## SMALL FOOTPRINT

From Jake Van Dyk, London Regional Cancer Center, London ON

# Shielding Blocks

Blocks add flexibility to construction projects but are much more expensive for large facilities.

Concrete Blocks

Nelco

Lead Blocks

Radiation Therapy Products Inc

# Self-Shielded Stereotactic Radiosurgery Unit, the Zap-X

Zap-X: A: Cross-Section and B: Room View

Weidlich et al Self-Shielding Analysis of the Zap-X System. Cureus 9(12)

# Leo Cancer Care Upright Radiotherapy System with a Small Footprint

Machine Fixed

Patient Rotated Upright

- Upright radiotherapy may be better medicine for many sites.
- Also with potential to self-shield.

# Proton Gantry Sizes

Gantry size is the major determinant in the high capital cost of proton radiotherapy

# Take Home Messages

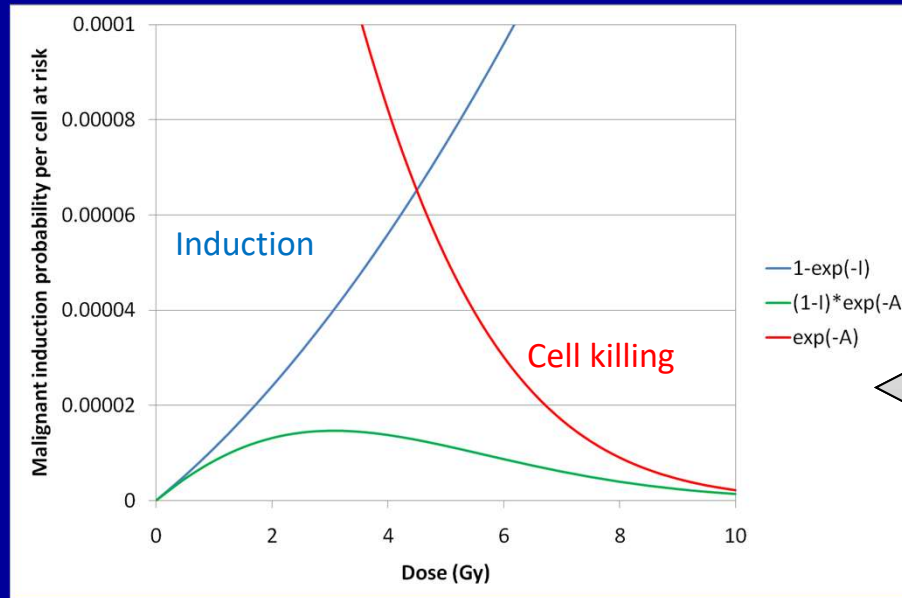

- **Modern radiation therapy is devoted to decreasing acute exposure to sensitive tissues using 3D conformal radiation therapy and intensity modulated radiotherapy (IMRT).**
- **Proton beams reduce integral dose.**
- **Image-guidance using CT and MRI assures less normal tissue is in the high dose field.**
- **Integral dose is a simple measure of patient harm.**
- **The ring gantry is rivaling the C-arm gantry and enables less unwanted radiation to escape the machine.**
- **Reducing vault size with ring gantries and smaller proton gantries will reduce the cost of radiotherapy.**

# Cancer Induction and Cell Kill

What is the form of the induction function? Linear, quadratic?

Form of cell killing function known with some certainty at clinical energies, the parameters are tissue dependent and can have large uncertainties.

Probability of induced cell surviving

Probability the cell survives

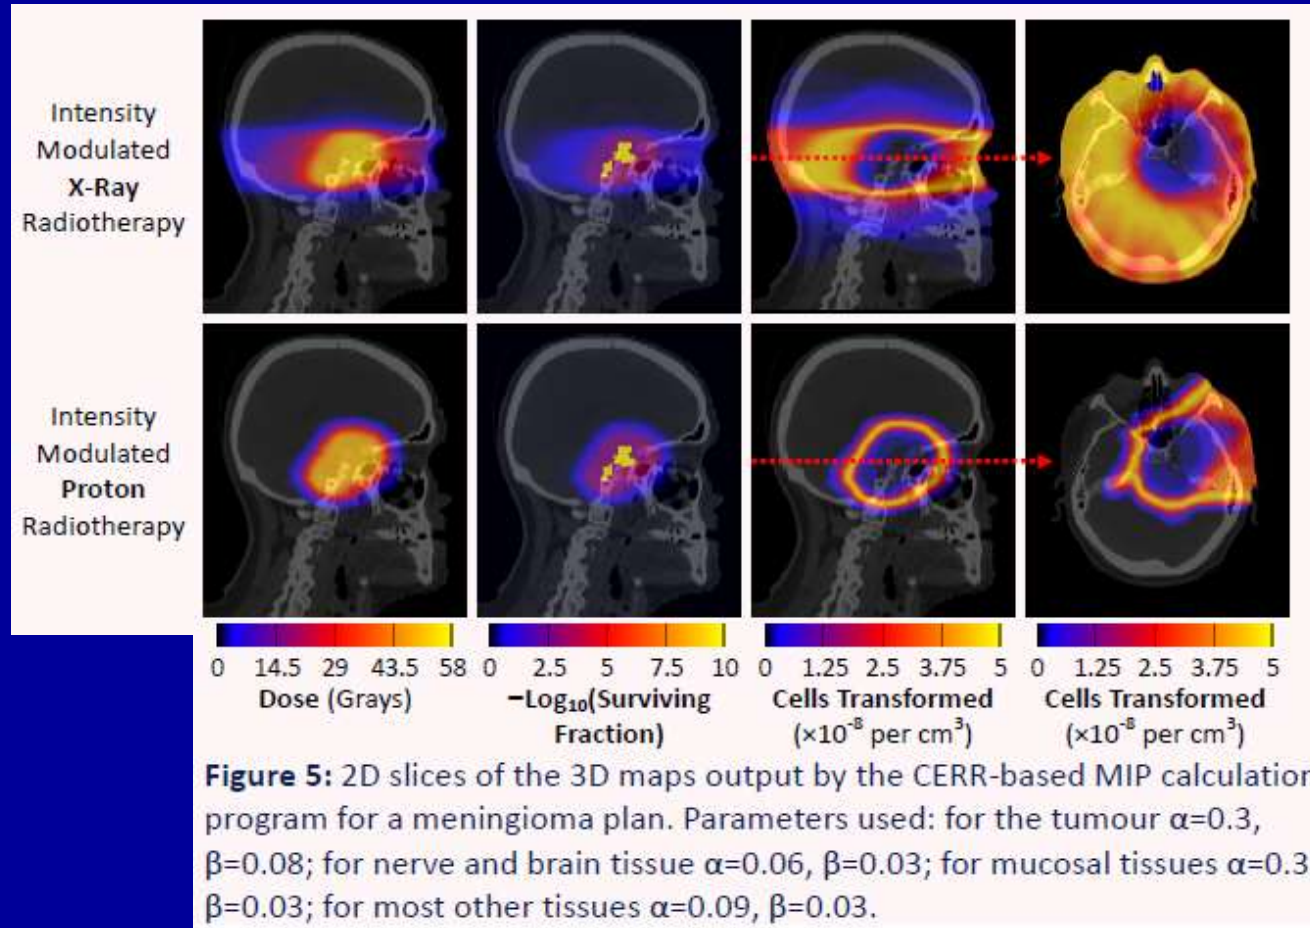

$$P_{tr} = P_I P_S$$

Probability of inducing a potentially malignant mutation

Risk needs to be:

- accurately modelled
- confirmed experimentally
- taken into account when deciding on the optimal treatment plan

# 3D Prediction of Cell Transformations

- Model and parameter sensitivity analyses
- Validation with clinical data on secondary malignancies

Hans

I think this is a good title:

Trending Issues with Radiation Protection for External Beam Radiation Oncology

I will talk about several issues. Perhaps the most important one is the changing whole body dose in radiation oncology. A number of factors including IMRT, CT image guidance and near universal use of PET imaging for treatment planning tend to increase the dose while a tendency towards hypofractionation decreases it. The growth of proton and heavy ion radiotherapy introduces challenges due to the RBE. I will also talk about self-shielded radiotherapy machines being introduced or in the planning stages. I will close with cost-benefit arguments justifying changes to whole body dose and radiation protection efforts to lower it.
